

## FIRE FIGHTING SYSTEM

Industrial fire fighting networks/rings are very often corroded, particularly due to stray currents or dissimilar metals couplings.

The systems, not often inspected, can be found damaged and out of service when they need to be fully operative. It is required by law, to maintain the fire fighting system in good and full efficiency to grant its benefit. Maintenance is extremely difficult and expensive, so the best solution is to apply a Cathodic Protection System to preserve the structures from corrosion, for long time.
